

Topic	MONITORING SYSTEM- 2	
Class Description	Students will be introduced to how to interface the BMP180 pressure sensor with ESP32 and they will learn to publish and subscription technique used in sending and receiving messages on the cloud server	
Class	PRO C249	
Class time	45 mins	
Goal	<ul style="list-style-type: none"> <li>• Introduction to Publish &amp; Subscribe</li> <li>• Send data to the server</li> <li>• Receive data from the server</li> </ul>	
Resources Required	<ul style="list-style-type: none"> <li>• Teacher Resources:               <ul style="list-style-type: none"> <li>○ Laptop with internet connectivity</li> <li>○ Earphones with mic</li> <li>○ Notebook and pen</li> <li>○ Smartphone</li> </ul> </li> <li>• Student Resources:               <ul style="list-style-type: none"> <li>○ Laptop with internet connectivity</li> <li>○ Earphones with mic</li> <li>○ Notebook and pen</li> </ul> </li> </ul>	
Class structure	<b>Warm-Up</b> <b>Teacher-Led Activity</b> <b>Student-Led Activity</b> <b>Wrap-Up</b>	<b>10 mins</b> <b>20 mins</b> <b>20 mins</b> <b>05 mins</b>
WARM-UP SESSION - 10 mins		
Teacher Action		Student Action

<p>Hey &lt;student's name&gt;. How are you? It's great to see you! Are you excited to learn something new today?</p> <p><b>Following are the WARM-UP session deliverables:</b></p> <ul style="list-style-type: none"> <li>• Greet the student.</li> <li>• Revision of previous class activities.</li> <li>• Quizzes.</li> </ul>	<p><b>ESR:</b> Hi, thanks! Yes, I am excited about it!</p> <p>Click on the slide show tab and present the slides</p>
<p align="center"><b>WARM-UP QUIZ</b> Click on In-Class Quiz</p>	
<p><b>Activity Details</b></p> <p><b>Following are the session deliverables:</b></p> <ul style="list-style-type: none"> <li>• Appreciate the student.</li> <li>• Narrate the story by using hand gestures and voice modulation methods to bring in more interest in students.</li> </ul>	
<p align="center"><b>TEACHER-LED ACTIVITY - 10 mins</b></p>	
<p align="center"><b>Teacher Initiates Screen Share</b></p>	
<p align="center"><b><u>ACTIVITY</u></b></p> <ul style="list-style-type: none"> <li>• <b>Introduction to libraries</b></li> <li>• <b>Publish &amp; Subscribe</b></li> </ul>	
<p><b>Teacher Action</b></p>	<p><b>Student Action</b></p>
<p>In the last class we designed a cloud server where we set gauges and toggle switches. But we haven't seen how this really works. Today we will send real-time sensor data on the server and receive the real-time data from the cloud server and with that, we can control our end devices like Led's</p> <p>So let's learn how to interface sensors and end devices</p>	

with the cloud server.	
<p><i>Note: The teacher will guide the student in making connections: This will be the same connection that we did in the last class.</i></p> <p><b>Step -1:Gather the material from the IoT kit:</b></p> <ul style="list-style-type: none"> <li>• 1 x ESP32</li> <li>• 1 x USB Cable</li> <li>• 1 x Breadboard</li> <li>• 4 x Jumper wires</li> <li>• 1 x BMP180</li> <li>• 2 x LED</li> <li>• 2 x Resistors</li> </ul>	
<b>Mount the components</b>	
	
<p><b>Step -2: Let's do connections:</b></p> <p><i>Note : Follow the same pins number as mentioned below to connect the sensor with ESP32</i></p>	

BMP180 Pins	Wiring Connections
VCC	Connect with <b>3V3 PIN</b> of the ESP32
GND	Connect with <b>GND</b> of the ESP32
SCL	Connect with GPIO <b>PIN 22</b>
SDA	Connect with GPIO <b>PIN 21</b>

**LED Connections:** Connect positive leg of **LED** with the resistor and negative with **GND(0V)**.  
Another end of the resistor with **GPIO pin 18**.

Do the same connection for the second **LED**, but this time connects with **GPIO pin 19**

SDA - D21      SCL - D22      RED LED - D18      GREEN LED - D19

<p><b>Let's write a program</b></p> <p>The top of the program has the includes. We will write all supporting header files and libraries</p> <p><b>include keyword</b> is used to import libraries in embedded language as we used to import in python language</p> <p><b>WiFi.h:</b> WiFi library will be able to answer all HTTP request</p> <p><b>Adafruit BMP085.h</b> Adafruit <b>BMP085</b> is used to connect the BMP180 sensor with the Adafruit dashboard.</p> <p>Adafruit supports a protocol called <b>MQTT</b>, or <b>message queue telemetry transport</b>, for communication with devices. To send and receive feed data,</p> <p><b>Adafruit_MQTT</b> header file tells about sending and receiving packets.</p> <p><b>Adafruit_MQTT_Client</b> allows you to publish to a feed.</p>	
<pre>#include &lt;WiFi.h&gt; #include &lt;Adafruit_BMP085.h&gt; #include "Adafruit_MQTT.h" #include "Adafruit_MQTT_Client.h"</pre>	
<p>After uploading libraries the next step is to connect with ESP32 with the WiFi. For that, we need to use SSID(Wi-Fi credentials i.e WiFi name and WiFi Password)</p> <ul style="list-style-type: none"> <li>• <b>WLAN_SSID, WLAN_PASS</b> are the variables that are used to save WiFi credentials. Set the <b>SSID</b> and <b>password</b></li> </ul> <p><i>Note: Teacher/Student should use their actual WiFi Credentials.</i></p>	

```
#define WLAN_SSID      "WR3005N3-757E"
#define WLAN_PASS      "70029949"
```

## Adafruit Setup and Authentication

Set the Adafruit **AIO\_SERVER** , **AIO\_SERVERPORT**, **AIO\_USERNAME**, **AIO\_KEY**

*Note: Red highlighted one need to change as per teacher and student adafruit credentials.*

```
#define AIO_SERVER      "io.adafruit.com"
#define AIO_SERVERPORT  1883                // use 8883 for SSL
#define AIO_USERNAME    "Tamtap"
#define AIO_KEY          "aio_ozIw67GZ2KKiwjN7Uvz5HDQeiuY0"
```

To get **AIO\_USERNAME** & **AIO\_KEY** go to adafruit, Click on **My Key**

After clicking on **My Key**, the following window will appear.

**Key** - This is a long, unique identifier that is used to authenticate devices using an Adafruit account.

Note down **IO\_USERNAME** & **IO\_KEY**, paste the same in the program where **AIO\_USERNAME** & **AIO\_KEY** is mentioned.

*Note: A very important step to connect the Adafruit server with ESP32*

**YOUR ADAFRUIT IO KEY** ×

Your Adafruit IO Key should be kept in a safe place and treated with the same care as your Adafruit username and password. People who have access to your Adafruit IO Key can view all of your data, create new feeds for your account, and manipulate your active feeds.

If you need to regenerate a new Adafruit IO Key, all of your existing programs and scripts will need to be manually changed to the new key.

**Username**

**Active Key**

[Hide Code Samples](#)

**Arduino**

```
#define IO_USERNAME "Tamtap"
#define IO_KEY      "aio_ozIw67GZ2KKiwjN7Uvz5HDQeiuY8"
```

**Linux Shell**

```
export IO_USERNAME="Tamtap"
export IO_KEY="aio_ozIw67GZ2KKiwjN7Uvz5HDQeiuY8"
```

**Scripting**

```
ADAFRUIT_IO_USERNAME = "Tamtap"
ADAFRUIT_IO_KEY = "aio_ozIw67GZ2KKiwjN7Uvz5HDQeiuY8"
```

[REGENERATE KEY](#)

**Publish & Subscribe**

**Publish** - push data from device to server for example. Sensor Data

**Subscribe**- push data from server to device for example. LED Control

Setup the MQTT client class by passing is Adafruit server set up details like **AIO\_SERVER**, **AIO\_SERVERPORT**, **AIO\_USERNAME**, **AIO\_KEY**

BMP180 which is used to sense temperature and pressure will use **Adafruit\_MQTT\_Publish** publish data, and to control LED from the server we use **Adafruit\_MQTT\_Subscribe**

**AIO\_USERNAME/feeds/temperature** is feed name

*Note: Below highlighted needs to be changed as per the feed name, which student/teacher has entered in very first step i.e Enter Feed Name*

*In the below screenshot, its name as temperature for Room Temperature, level for Pressure, sw1 for Room AC, sw2 for Room Light*

```
WiFiClient client;

Adafruit_MQTT_Client mqtt(&client, AIO_SERVER, AIO_SERVERPORT, AIO_USERNAME, AIO_KEY);

Adafruit_MQTT_Publish temperature = Adafruit_MQTT_Publish(&mqtt, AIO_USERNAME "/feeds/temperature");
Adafruit_MQTT_Publish level = Adafruit_MQTT_Publish(&mqtt, AIO_USERNAME "/feeds/level");
Adafruit_MQTT_Subscribe sw1 = Adafruit_MQTT_Subscribe(&mqtt, AIO_USERNAME "/feeds/sw1");
Adafruit_MQTT_Subscribe sw2 = Adafruit_MQTT_Subscribe(&mqtt, AIO_USERNAME "/feeds/sw2");
```

**MQTT\_connect** will establish a connection of ESP32 with cloud server

```
void MQTT_connect();
```

*Note: Teacher start writing code from here*

Define **GPIO pins**

- Define **LED's pin** along with data type **int**
- Define Variable **p** with datatype **float**
- Define **String** variable to store value
- Define **bmp** object for **Adafruit\_BMP085**

```
const int led1 = 18;
const int led2 = 19;

float p;

String stringOne, stringTwo;

Adafruit_BMP085 bmp;
```

### Initialize the setup()

- **Serial. begin(9600)** is used for data exchange speed. speed parameters. This tells the Arduino to get ready to exchange messages with the Serial Monitor at a data rate of 9600 bits per second. That's 9600 binary ones or zeros per second and is commonly called a baud rate.
- Set a **delay** of **10 ms**
- **pinMode()** configures the specified pin to behave either as an input or an output. As we want to act as output we are writing **OUTPUT** here. Set the pinMode for both **Led1, Led2**
- **digitalWrite()** function helps to change the state of LED from **HIGH to LOW** or vice versa

```
void setup() {
  Serial.begin(9600);
  delay(10);

  pinMode(led1, OUTPUT);
  pinMode(led2, OUTPUT);

  digitalWrite(led1, LOW);
  digitalWrite(led2, LOW);
}
```

**Serial. println** is used to print the statement

This section will show details while connecting to the Internet. Basically, it will show when it gets connected with Wi-Fi

```
Serial.println(F("Adafruit MQTT demo"));

// Connect to WiFi access point.
Serial.println(); Serial.println();
Serial.print("Connecting to ");
Serial.println(WLAN_SSID);

WiFi.begin(WLAN_SSID, WLAN_PASS);
while (WiFi.status() != WL_CONNECTED) {
  delay(500);
  Serial.print(".");
}
Serial.println();

Serial.println("WiFi connected");
Serial.println("IP address: "); Serial.println(WiFi.localIP());
```

Basically, our purpose is to publish the sensor data and control the LEDs using an Adafruit server.

To do this we must be aware of two terms publish and subscription

- Setup **MQTT** subscriptions for **led1**, **led2** i.e. **sw1**, **sw2**. **sw1** and **sw2** are the feed names that we entered at the very first step of naming the feed.
- **bmp. begin()** is used to start the process.
- Print ("Could not found", if the sensor fail to start the process

```
mqtt.subscribe(&sw1);
mqtt.subscribe(&sw2);

if (!bmp.begin()) {
  Serial.println("BMP180 Sensor not found ! ! !");
  while (1) {}
}
}
```

The unsigned uint32\_t data type works on 32-bit numbers.

To execute the main process write the **void loop()**

- The **readPressure()** function will read the pressure around us
- The **readTemperature ()** function will read the pressure around us
- Store the sensor's pressure value into variable **p**
- Set a delay of **100 ms**
- **MQTT\_connect** function instructs the library to start connecting to the server. This will ensure that the connection to the MQTT server is alive.

```
p = bmp.readPressure();
q = bmp.readTemperature();
Serial.println(p);
Serial.println(q);
delay(100);

MQTT_connect();
```

Teacher Stops Screen Share

So now it's your turn.  
Please share your screen with me.

We have one more class challenge for you.

<p>Can you solve it?</p> <p>Let's try. I will guide you through it.</p>	
STUDENT-LED ACTIVITY - 20 mins	
<ul style="list-style-type: none"> <li>• Ask the student to press the ESC key to come back to the panel.</li> <li>• Guide the student to start Screen Share.</li> <li>• The teacher gets into Full Screen.</li> </ul>	
Student Initiates Screen Share	
<p style="text-align: center;"><u>ACTIVITY</u></p> <ul style="list-style-type: none"> <li>• Student Activity description (in bullet points).</li> </ul>	
Teacher Action	Student Action
<p>So after the connection check, the server waits for subscriptions to come in. Now it's time to send data from server to LED's</p> <p>We know to send data from server to end devices(LED's) we need to use the <b>Subscribe</b> function.</p> <p>Create the <b>Adafruit_MQTT_Subscribe</b> object <b>subscription</b>, using object subscription we can interact and subscribe. We'll use this to determine which subscription was received.</p> <p><b>readSubscription()</b> will sit and listen for up to 'time' for a message. It will either get a message before the timeout and reply with a pointer to the subscription <b>or</b> it will timeout and return <b>0</b>. In this case, it will wait up to 5 seconds for a subscription message.</p> <p>Compare the latest feed to the <b>sw1</b> feed. If they match, we can read the last message using <b>lastread</b></p>	

If the read times out, the while loop will fail

Now it's time to print out the received data but also compares the data to determine whether the string received is **ON** or **OFF**

Since adafruit.io publishes the data as a string, we are using **string**. **stringOne**, **stringTwo** will save LED's ON or OFF

**digitalWrite()** will change the state of LED using **HIGH** or **LOW**

If it is **ON** then make it **HIGH**, otherwise make it **LOW**

```
Adafruit_MQTT_Subscribe *subscription;
while ((subscription = mqtt.readSubscription(5000))) {
  if (subscription == &sw1) {
    stringOne = (char *)sw1.lastread;
    Serial.print(F("stringOne: "));
    Serial.println(stringOne);
    if (stringOne == "ON") {
      digitalWrite(led1, HIGH);
    }
    if (stringOne == "OFF") {
      digitalWrite(led1, LOW);
    }
  }
  if (subscription == &sw2) {
    stringTwo = (char *)sw2.lastread;
    Serial.print(F("stringTwo: "));
    Serial.println(stringTwo);

    if (stringTwo == "ON") {
      digitalWrite(led2, HIGH);
    }
    if (stringTwo == "OFF") {
      digitalWrite(led2, LOW);
    }
  }
}
```

Now, it's time to publish the **BMP180** data, We need to publish Pressure and Temperature,

The publication is much easier than subscribing, we need to just call the **publish** function of the feed object.

BMP180 can measure temperature and pressure

Publish the temperature and subtract that temperature from temperature\_sens\_read and then convert it into Fahrenheit.

<p>Convert raw temperature in Fahrenheit to Celsius degrees</p> <p><math>F = 32 + 1.8C</math></p> <p>We can check for success or failure of publication by using the <b>Serial.print</b> function.</p>	
<pre> if (! temperature.publish(((temprature_sens_read() - 32 ) / 1.8))) { } else {     //Serial.println(F("Teamp OK!")); }  if (! level.publish(p)) {     //Serial.println(F("pressure Level Failed")); } else {     //Serial.println(F("pressure Level OK!")); } </pre>	
<p>Function to connect and reconnect as necessary to the MQTT server alive.</p> <p>It should be called in the loop function and it will take care of connecting.</p> <p>If gets disconnected then try to connect it again.</p> <p><b>ret</b> is a variable which will save temporary return value in datatype <b>int</b></p>	

```
void MQTT_connect() {  
    int8_t ret;  
    if (mqtt.connected()) {  
        return;  
    }  
  
    uint8_t retries = 3;  
    while ((ret = mqtt.connect()) != 0) { // connect will return 0 for connected  
        mqtt.disconnect();  
        delay(5000); // wait 5 seconds  
        retries--;  
        if (retries == 0) {  
            while (1);  
        }  
    }  
}
```

### Output:

Compile and upload the program to ESP32 board using Arduino IDE

- Verify the program by clicking the Tick option
- Upload the program by clicking the arrow option

*Note: If the port is not selected, insert the USB cable in Computer's port and select the port*

- Go to Tools and select Serial Monitor

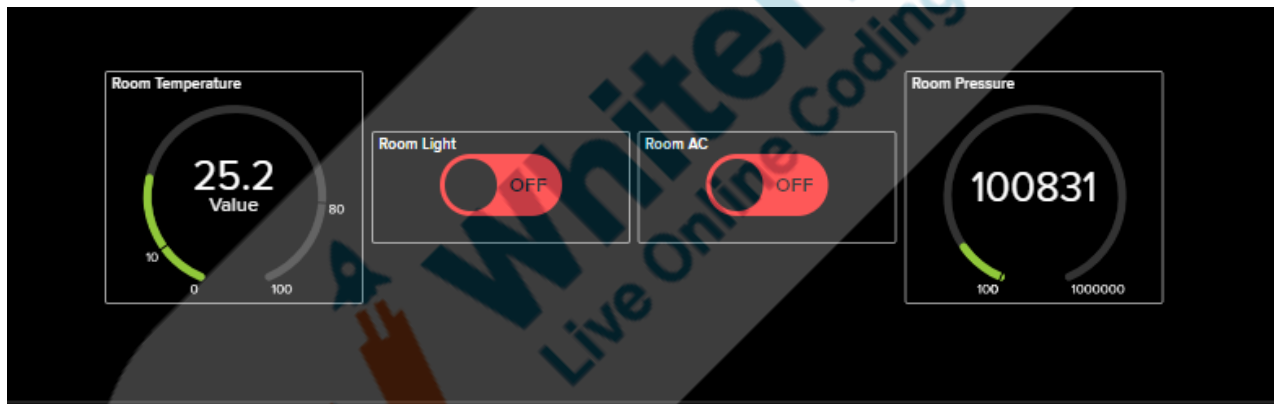

**Error Message:** If an error message comes like no such file or directory then use the below method to resolve this error

Go to **Tools**

- Click on **Manage Libraries**
- Write the component name which needs to install
- Click on Install

Go to Tools and select **Serial Monitor**

- See the **Pressure** and **Temperature** value
- Open your Adafruit server and check the live values of Pressure and Temperature. Click the Toggle buttons to turn ON and OFF your LED's

So, Today we made an arrangement where we saw the exact readings of the pressure and temperature around us using a **BMP180** sensor and even we learned how to publish and subscribe data

That's fun!

**Teacher Guides Student to Stop Screen Share**
